ProtoThrottle

Realistic Control Stand Throttle

MANUAL

Ver. 2, 2/18

PRELIMINARY, SUBJECT TO CHANGE

iSE

IOWA SCALED ENGINEERING — ELECTRONICS MADE EASY!

www.protothrottle.com

Thank you for purchasing the ProtoThrottle.

Our goal was to design and develop a wireless throttle that provides the diesel modeler with the most realistic experience operating their model locomotives.

The ProtoThrottle mimics a standard EMD control stand including full detent throttle and reverser handles, a spring-loaded horn handle, a push-on/push-off bell button, and fully programmable front and rear headlights with a setting for ditch lights. In addition, the ProtoThrottle comes with a robust faceplate machined from aluminum, including prototype bezels, and anodized to give the look and feel of a real control stand.

The ProtoThrottle comes with our commitment to your satisfaction. We warranty the throttle from manufacturing defects for one year, and if you should have any questions or issues with the ProtoThrottle, please contact us.

**Scott Thornton**   **Michael Petersen**   **Nathan Holmes**

Lanyard attachment

The ProtoThrottle is powered by 2 AA batteries (not included). The batteries can be alkaline or rechargeable NiMH.

To access the battery holder, unscrew the 4 phillips head screws on the corners of the throttle's faceplate; remove the box; **IMPORTANT:** when removing the batteries from the holder, use one hand to hold **both** sides of the holder to prevent it from bending away from the printed circuit board; insert batteries and reattach the box. **Do not over tighten the screws.**

To conserve battery life: make sure the throttle handle is in "idle" position and the reverser handle is in "centered" position when not in use. This will cause the throttle to go to sleep after 5 minutes.
Quick Start Guide

The ProtoThrottle will work with any scale and with sound- or non-sound decoders (though using sound enhances the control stand experience significantly). All of the current decoders on the market will work with the ProtoThrottle because it uses standard DCC commands and functions. The ProtoThrottle is not a DCC system and will not replace the system you use.

The ProtoThrottle currently supports the following DCC command stations:
• NCE
• ESU Cab Control
• Lenz
• DigiKeijs DR5000

Support for additional systems is in development.
Check the Iowa Scaled Engineering website periodically for updates –
www.iascaled.com

NOTE: if the ProtoThrottle is in "sleep" mode the LCD screen will be dark, click any of the LCD buttons to wake the throttle.

1

1. Configure your ProtoThrottle receiver using the instructions provided with the receiver.

2. Make sure the base address of the ProtoThrottle matches that of the receiver. (See page 16.)

3. If using multiple ProtoThrottles, set each throttle to a unique ID. (See page 16.)

2

Using your DCC system, **set acceleration momentum mid-range to moderately high** so that the ProtoThrottle will need to "notch up" to get the train moving.
Set deceleration momentum high or maximum depending on your decoders braking function. This will allow the train to "coast" when the throttle is in the idle position requiring the use of the brake to slow or stop the train.
3

**Input the locomotive number into the ProtoThrottle:**
| SET ←─ LOCO | 1. Click the Menu button 4 times | 0003 ^ | 2. Click the Select button once | 4003 ^ | 3. Use the Up and Down buttons to change numbers |

| 4003 ^ | 4. Use the Menu button to move cursor right | 4795 ^ | 5. After number is input, click Select button to save | SAVED! | |
NOTE: the ProtoThrottle function settings are set to standard DCC function numbers by default. If you need to change any function number, the steps are explained below:

4

To set the horn, bell, and brake function numbers:
| CONFIG ←─ FUNC | 1. Click the Menu button 6 times | HORN F02 | 2. Click the Select button once | HORN F07 | 3. Click the Up or Down button to change the function number |

| BRAKE F10 | 4. Click Menu button to toggle through the other function choices. Repeat step 3 to change additional function numbers. | SAVED! | 5. Click the Select button to save all changes | | |
5

Enjoy operating your locomotive!

Please read the entire manual to familiarize yourself with all the features of the ProtoThrottle. See our website for more specific instructions on programming lights and our future tonnage feature.

In addition, our website has detailed operational scenarios developed by professional locomotive engineer, Tim Garland. If you are not familiar with prototype operation from a engineer's perspective, Tim's scenarios will give you insight on how to operate more realistically using the ProtoThrottle.

5

Main Screen

```
▊ 0250 ▢
12:00ᴬ ▢
```

ELEMENT	DESCRIPTION
0250	Locomotive Address. Extended (also known as long or 4-digit) addresses are displayed directly (e.g. 0250 0000 9999). Primary (also known as short or 2-digit) addresses are displayed with an 's' prefix (e.g. s003 s000 s127). After the locomotive address is set it will display constant. In certain situations it may be replaced by an alert message: EMRG Emergency stop is active! REV! Reverser was moved with the throttle not in idle
12:00ᴬ	The ProtoThrottle acts as a secondary display for Iowa Scaled Engineering's wireless fast clocks www.iascaled.com/store/MRB-FCM or the fast time provided by the NCE Cab Bus. ᴬ 12-hour mode AM indicator ᴾ 12-hour mode PM indicator No AM or PM indicator when in 24-hour mode.
▊	Battery Status ▊ Batteries good ▊ Batteries low ▯ Replace batteries
▢	Up/Down Button Status. On the main screen, the Up and Down buttons can be assigned to functions. The on/off status of those assigned functions are displayed on the LCD screen. ▢ Function off ● Function on

Advance to Engine Menu ●

Toggle backlight on / off ●

LCD Screen
● Up

● Down

NOTE: these buttons can be assigned a function using the Configure Function menu

Engine Menu

```
ENGINE
OFF
```

DESCRIPTION

The behavior of the Engine menu depends on the configuration of the `ENG ON` and `ENG STOP` settings in the **Configure Function menu**. For DCC decoders that take a single function on/off to turn the prime mover on/off (such as ESU Loksound decoders), configure `ENG ON` to that function number and set `ENG STOP` to off. The Engine menu will then change between OFF and ON when pressing the Up and Down buttons.

```
ENGINE          ENGINE
OFF             ON
```

If a decoder is edge triggered instead (requires a function on/off transition) to turn the prime mover on and off (such as Soundtraxx Tsunami 2), set both `ENG ON` and `ENG STOP` to the appropriate function numbers. In this case, the Engine menu will display STARTING and STOPPING between the ON and OFF settings as the appropriate functions are pulsed.

```
ENGINE      ENGINE       ENGINE      ENGINE       ENGINE
OFF         STARTING     ON          STOPPING     OFF
```

If the throttle is not in idle when attempting to turn off the prime mover, a warning will be displayed and the `ENG STOP` function will not be sent. Move the throttle back to idle to continue.

```
NOT
IDLE
```

Example #1, F8 for ESU Loksound:
ENG ON = F08
ENG STOP = F--

Example #2, F5 (on, RPM+) and F6 (off, RPM-) for Soundtraxx Tsunami 2:
ENG ON = F05
ENG STOP = F06

Advance to Tonnage Menu ●   Start or turn on prime mover

Communication Configuration Sub-Menu

ELEMENT

DESCRIPTION

```
THRTL ID
   A
```

Throttle ID. Set each throttle to a unique ID using letters A-Z

```
BASE ADR
   04
```

Base Address. Set to the address of the ProtoThrottle receiver –
see reciever instructions.

```
TIME ADR
  BASE
```

Time Source Address. Selects the fast time source. Set to "BASE"
to display time information received from the command station
by the ProtoThrottle receiver. To use an Iowa Scaled Engineering
Wireless Fast Clock Master, set to the Node Address of the clock
(0x01 to 0xFE). Set to "ALL" to display any time information
received by the ProtoThrottle. The "ALL" setting works well with
a single receiver in a private setting, but may result in erratic time
display when multiple ProtoThrottle receivers are in close proximity
(e.g. a public train show).

Preferences Sub-Menu

ELEMENT

DESCRIPTION

```
SLEEP
DLY:  5M
```

Sleep Delay. Time until the throttle automatically enters low power mode. The throttle handle must be in idle, the reverser handle in centered position, and no buttons or controls actuated for this time. Range from 1 to 99 minutes.

```
TIMEOUT
CLK: 10s
```

Clock Timeout. Maximum time between fast clock time packets. If no time information is received in this interval, the clock display will show dashes to indicate it has lost communication with the fast clock master. Range from 1 to 25 seconds.

```
TX INTVL
      1s
```

Transmit Interval. Time between periodic wireless transmissions to the ProtoThrottle receiver. This setting is locked and should not normally need to be changed by the user.

```
TX HLDOF
   0.15s
```

Transmit Holdoff. Minimum time between wireless transmissions to the ProtoThrottle receiver. This setting is locked and should not normally need to be changed by the user.

```
VAR BRK
     ON
```

Variable Brake. When set to ON, the brake function will be pulsed at a duty cycle corresponding to the brake handle position, simulating varying amounts of braking force. It is recommended to disable the emergency brake when variable braking is enabled. When set to OFF, the brake will be a simple on/off function based on the brake calibration setting (see the Threshold Calibration Menu).

```
BRK PWM
   1.0s
```

Brake Pulse Timing. This sets the rate at which pulse commands are sent during braking. A smaller value results in smoother braking but can result in a less responsive system due to the higher rate at which commands are being sent.

17

www.protothrottle.com

Continued from previous page

ELEMENT	DESCRIPTION

```
BRK ESTP
      ON
```

E-Stop on Brake Handle. When set to ON, the brake handle can set emergency stop for the selected locomotive when moved past the Brake High threshold. When set to OFF, the brake handle will not cause an emergency stop to be set.

```
LED BLNK
      ON
```

LED Blink. When set to ON, the LED on the ProtoThrottle will blink green when communication with a ProtoThrottle receiver is active. When set to OFF, the LED will remain off when communication is active. The LED will always blink red when no communication link has been established.

```
REV SWAP
     OFF
```

Reverser Swap. When set to ON, the reverser directions are swapped. This can be used to correct for a locomotive whose direction is set incorrectly or when changing the leading end of a back-to-back consist. When set to OFF, the reverser directions are normal.

```
REV LOCK
      ON
```

Reverse Lock. When set to ON, the reverser can only change the locomotive direction when then throttle is in idle, just like the prototype (in fact, on the prototype, the reverser handle is locked and cannot be moved). If the reverser is moved when the throttle is not in idle, the direction will remain the same and the Main Screen will display REV!. When set to OFF, the reverser is allowed to change the direction regardless of the throttle setting.
